APCS File exercises.

1. This program will use the Cities.txt file in the Post AP folder in Schoology.

Suppose this is a list of the U.S. cities that you have visited. Write a program that will allow the user to enter their recent cities into the program. If any of these cities are not in the text file, they should be added to the end of the list. The user should be allowed to enter as many as they wish, you can have them enter 'stop' to quit input.

2. This program will use the Orders.txt and Prices.txt files.

You will read in each item from the Orders file. For each item, you must obtain the price from the Prices file and then output a line to an output file that states the following

ID Qty Subtotal

After all subtotals are written to the file, a final total should be written at the end. Have the user give the name for the output file.
